

### 1.1P Reflection/Screenshots

This task was a comprehensive lesson in the fundamental skills required for front-end web development. The creation of an HTML page allowed me to put into practice the basics of HTML, including tags like `<img>`, `<table>`, and `<form>`. Incorporating an image using the 'src' attribute, generating a simple table, and creating a form enhanced my understanding of these core HTML elements.

Applying CSS styling to the page expanded my knowledge of the three methods of integrating CSS with HTML: inline, internal, and external. This allowed me to understand how different CSS styling techniques can provide flexibility and control over the presentation of web content.

Adding a JavaScript reference further deepened my understanding of the nature of web development. The use of JavaScript highlighted how client-side scripting can bring interactivity and functionality to a webpage, complementing the structure provided by HTML and the aesthetics enhanced by CSS.
